Prior Art Rejections

- 1) The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2) Claims 1 to 13 are rejected under 35 U.S.C. 103 (a) as being unpatentable over Suzuki et al EP 726,591 (Suzuki '591) in view of Cherry et al 4,849,674 (Cherry) and Suzuki et al EP 729,168 (Suzuki '168). Suzuki '591 discloses the steps of fabricating an electron source composed of plural electron emission devices connected in a matrix by plural row wirings and plural column wirings, comprising forming a matrix of emitter device pre-elements, dividing the matrix of pre-elements into plural groups and sequentially applying an activation voltage to each group to generate a carbon deposit in a gap portion of each pre-element. Suzuki '591 differs from claim 1, in that it is not disclosed to sub-divide each group into subgroups and to simultaneously apply activation voltage to at least one pre-element of each subgroup as a unit. Cherry teaches an activation process comprising dividing the row wirings into 16 groups of row wirings with adjacent wires of each group spaced apart 16 rows so that the nth and n+1th groups of wires activated in succession can be spaced apart from each other. See Cherry, column 3, lines 23-26 wherein it is stated that "Spaced sets of electrodes are cycled in this fashion for about 90 minutes until the panel has initially been formed to about 25 volts. The spacing of the successive groups of electrodes from each other is to allow the electrodes of the nth

· Application/Control Number: 09/512,360

Art Unit: 2879

group to cool as the n+1th group is activated. See Cherry, column 3, lines 22-23. Thus in Cherry there are rows in between the successively activated rows which are not activated. Furthermore, the patent to Suzuki '168, page 13, lines 21-23, further states that plural groups (columns) could be selected and the pulse forming voltage applied successively to the groups sequentially in a "zigzag manner" to avoid excessive heating of the central portion of the substrate during the creation of an electron emissive device as noted to be a problem at page 4, lines 23-25. This teaching suggests again the desirableness of spacing the successively actvated devices from each other so that there are rows (or columns) that have no current applied between the successively actvated rows (or columns). Therefore the subject matter of claim 1 is clearly obvious from Suzuki '591 in view of Cherry and Suzuki '168 since the obvious purpose of cycling the current in Suzuki '591 is to avoid excessive local heating of the device substrate and the further apart that the successively energized wires are, the less likely the chance of thermal damage. As to claim 2, the deposit in the gaps of the emitters comprises carbon. See Suzuki '591, column 7, lines 1-9. As to claim 3 the units of Suzuki '591 consists of a row or column as claimed, see Suzuki '591, column 26, lines 16-26. As to claims 4-8, to carry out the desired result, it would have been obvious to space the groups and subgroups so that the pitch between each row wiring of a unit corresponds to the number of rows in each subgroup since then it is possible to include a like number of devices in each of the activated groupings. As to claim 9-12, no difference is seen between the image device of Suzuki '591 wherein the activation voltage is applied to Application/Control Number: 09/512,360

Art Unit: 2879

spaced apart rows as a unit to shorten process time as taught by Cherry and Suzuki '168 and the image device or electron source defined by any of these claims. As to claim 13, the device of Suzuki '591 is an image forming apparatus for forming an image as stated in the claim.

Directions for Responses

Any formal response to this communication should be directed to examiner Kenneth Ramsey, Art Unit 2879, and either

703-872-9318; faxed to:

or mailed to: Assistant Commissioner For Patents

Washington, D.C. 20231

Technical inquiries concerning this communication should be directed to Kenneth J. Ramsey, (703) 308-2324 (voice), (703) 746-4832 (fax).

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-308-0956.
